

Custom Automotive Accounting & Inventory Software

Phase 1 Implementation Plan | Surat, Gujarat

This document outlines the Phase 1 implementation plan for a custom, high-performance accounting and inventory management system designed specifically for the daily operations of Hariram Motor. The software focuses on replacing manual bookkeeping with a secure, automated, and easy-to-use digital platform.

1. Core Modules (Phase 1)

To ensure a smooth transition and rapid deployment, Phase 1 focuses exclusively on the most critical financial and operational workflows.

Vehicle Inventory & Costing (Khata)

A specialized ledger for every vehicle to track exact profitability. Each car is added with its base purchase price. Any subsequent expenses (repairs, RTO fees, accessories) are linked directly to that specific vehicle. Upon sale, the system instantly calculates the true profit margin.

Advance & Expense Ledger (Udhar System)

A digital ledger system for staff and external vendors. Tracks advance payments given to employees (e.g., petty cash). When staff submit expenses for parts or services, the system automatically credits their account and debits the specific vehicle or operational account, providing real-time balance tracking at month-end.

Dual-Ledger Daily Book (Rojmel - Cash & Bank)

A master dashboard capturing all incoming and outgoing funds for the day, with strict segregation between **Physical Cash** and **Bank/UPI Transactions**. This provides the business owner with two distinct daily balances, allowing for instant cash-drawer verification against bank receipts without manual sorting.

2. UI/UX & Usability Strategy

The system is engineered for ease of use, ensuring that clerks, mechanics, and owners can operate it with zero technical training.

Designed for the Automotive Workflow

- **Localized Terminology:** The interface will utilize familiar terms (Rojmel, Udhar, Jama) with options to support Gujarati/English dual-language interfaces.
- **Distinct Cash vs. Bank Visibility:** Visual indicators (color-coded tags and split columns) ensure users can instantly differentiate between a cash payment and a bank transfer on the dashboard.
- **Mobile-First PWA:** The software can be installed as an app directly on the user's mobile home screen, perfect for moving around the garage or lot.

3. Technical Architecture

Built on modern, enterprise-grade web technology to ensure data security and speed.

Component	Technology Choice & Benefit
Frontend Framework	Next.js & Tailwind CSS (Lightning fast, highly responsive UI)
Database Infrastructure	PostgreSQL / Secure Relational DB (Guarantees financial data integrity and strict payment-mode enforcement)
Deployment & Backup	Cloud-hosted with automated daily snapshots to ensure zero data loss.

4. Proposed Timeline (Phase 1)

Phase	Focus Area	Estimated Time
Week 1	UI wireframes, Dashboard design, and Client approval.	1 Week
Week 2-3	Database setup, Car Costing Module, and Udhar Ledger logic.	2 Weeks
Week 4	Dual-Ledger (Cash/Bank) integration, Mobile Optimization, and Testing.	1 Week

Note: Features outside of this Phase 1 scope (such as RTO tracking, complex loan management, or third-party broker commissions) will be scoped and priced separately in Phase 2 based on client feedback from this initial rollout.
